How do students best learn biology and the nature of science?

Cartoons represent misconceptions about evolution...

Adaptation doesn't involve trying.

Natural selection does not grant organisms what they "need".

My current research addresses two main areas- biology education and the evolution of mating behavior. In biology education, I'm looking at how effective various teaching strategies are in teaching students key biological concepts.

My second main research interest currently is looking at boxing behavior in Caribbean crickets and figuring out under what conditions males box and if females prefer males that win.
